

Create Vue

- **Create Vue** is a tool for creating a Vue project from scratch. It runs on the **Vite** build tool.
- We configured ESLint as our linter, Prettier as our formatter, and Vitest as our test runner.
- **Hot reloading** is a feature that re-renders our Vue application when code changes in our editor.

Mounting the Vue App

- Our **index.html** file is barebones and consists of a single **<div>**.
- We create our Vue app by mounting a root component inside the **<div>**. Vue takes care of all future DOM updates.

Vue Components

- We store Vue components in **.vue** files.
- A Vue component includes a **<template>** section for HTML, a **<script>** section for JavaScript, and a **<style>** section for CSS. The order isn't technically required but is common convention.

Vue Dev Tools

- Components enable reusability. We can isolate a piece of the user interface into its own component.
- The **Vue Dev Tools** Chrome extension displays the component hierarchy and provides debugging support.
