

Composition API

- We learned and reviewed how to use the Composition API to replace:
 - data
 - methods
 - computed
 - this.\$router
 - this.\$route
 - getters
 - actions

Composables

- The Composition API replaces lots of functionality with helper functions or **composables**.
- To work with the Pinia store, we utilize the **use** functions.
- To work with Vue Router, we import **useRoute** and **useRouter**.

More on Composables

- A **composable** is a helper function that utilizes Vue's reactive features. The intent is that a component is *composed* of lots of smaller, reusable functions that provide reactive objects.

Updating Tests

- Our tests no longer mock out properties via **mocks** on the config object.
- Rather, they mock out the helper functions that the component utilizes (**useStore**, **useRoute**, etc).
