

Vue Testing Library

- The **Vue Testing Library** allows us to mount and interact with Vue components in a simulated browser environment.
- We added some global setup to “cleanup” the DOM after each test to ensure each test starts with a clean state.

Vue Testing Library

- The **render** function renders a component to the virtual DOM.
- Its second argument allows us to customize certain aspects of the component. Sometimes, this adjustment is necessary. Other times, it only makes the tests more brittle.

Vue Testing Library

- We can use the **screen** object to query/search the DOM for elements in various ways (by role, by text, by label, etc).
- The synchronous **getBy** family of methods searches for *one* HTML element with the given criteria. We used **getByText** to search by text.
