

User Story

As a user, I'd like to navigate between multiple *pages* of job listings so that I am not overwhelmed by the content on my screen.

The slice Method

- The **slice** method returns a copy of an array. We can use it to extract a subset of the original array's elements.
- Create a **computed** property for any *derived* data, such as our subset of 10 jobs from the original 100.

Mocking out Objects

- Keep tests simple. Mock out complex objects like **\$route** or API responses with simple JavaScript objects that can play the same role. This also decouples the component from its dependencies for testing.

Debugging

- We can use **it.only** to ask Vitest to run *one* test in a test suite.
- Use **screen.debug** to output the current HTML for the rendered component.

Environment Variables

- Environment variables are key-value pairs. Vite loads a file of environment variables based on the *environment* the app is running in (development, production, or test).
- Use environment variables to store settings/config for different environments.
