Pinia Actions

- Actions can perform asynchronous operations like making API requests. They then update Pinia state with their responses.

- Moving logic out of components into Pinia actions separates concerns. It also allows other components to have access to Pinia state + actions.

Testing

- We can mock out libraries like Axios with **vi.mock**.

- We can utilize **createTestingPinia** in our component tests to have a global Pinia instance with writable state properties and actions replaced by mock functions.
