Vue Directives

- The **v-bind** directive binds/connects a piece of data to an HTML attribute.

- We can use **:attr** as a shortcut to **v-bind:attr**.

- The **v-for** attribute creates an HTML chunk for every element in an iterable (such as an array or object).

The key Attribute

- We need to bind a unique value to the **key** attribute in a **v-for** to enable Vue to differentiate between the elements.

- We can configure Tailwind utility classes that apply a style to only the first child element in a group.

Vue Testing Library Query Methods

- The **getBy** family of methods searches for *one* matching element based on some criteria (text, role, etc). Vue Testing Library recommends **getByRole** if possible.

- The **getAllBy** family of methods returns an array of *all* matching elements based on some criteria.
