Lifecycle Hooks with Composition API

- Vue includes helper functions for reacting to lifecycle hooks. We used **onMounted**, which runs the function we pass to it when the component mounts.

Composables

- A **composable** is a function that returns reactive state.

- We can test the composable independently of a component. Stick with simple JavaScript objects when mocking out composable functions in component tests.

The value Property

- When returning reactive/computed values from a composable, remember to access the **value** property where it's being used.

- Be mindful of reactive objects versus objects with reactive properties.
