Global Components

- **Global components** can be used in any Vue component. We do not need to import them and register them locally.

- Be careful with **global components**, as they can increase your bundle size.

- Font Awesome is a collection of free icons.

Rendering Font Awesome Icon

- We rendered a **<font-awesome-icon>** component and used its **icon** prop to customize the actual icon.

- Use a **v-bind** directive whenever passing a prop value that is *not* a string.

Testing

- A **stub** is a replacement or stand-in for a real component. We can use it to simplify tests by focusing on the component under test.

- We can tell Vue Testing Library to stub out global components. We used this technique to stub out the **FontAwesomeIcon** component.
