Wildcard Routes

- We can create a Vue Router route with a dynamic segment (wildcard). We provide the segment with a name, which Vue will make available in the **params** object in the **$route** object.
  - /jobs/results/:id

- Vue Router will match the wildcard with *any string*.

Query Params

- **Query params** attach additional information to the end of a URL through the use of key value pairs.
  - **?key=value&a=b**

- A form emits a **submit** event when the user submits it. We can attach the **prevent** modifier to prevent a page refresh.
  - **@submit.prevent="someMethod"**

Mocking Dependencies

- We can use the **mocks** property in our test configuration object to mock out/replace global properties with our own custom objects.

- We replaced the **$router** and **$route** properties with simpler JavaScript objects. This decouples the tests from the real Vue Router implementation.
